## Skills

|                       |                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------|
| <b>Languages</b>      | JavaScript, TypeScript, Python, Ruby, HTML, CSS                                               |
| <b>Front End</b>      | React, Next.js, Astro, Redux Toolkit, Redux-Saga, React Native, Tailwind CSS, Sass, shadcn/ui |
| <b>Backend / APIs</b> | Node.js, GraphQL, REST APIs, PostgreSQL, DynamoDB, Rails                                      |
| <b>Infrastructure</b> | AWS (Lambda, DynamoDB, S3), Serverless Architecture, Firebase, Vercel                         |
| <b>Tools</b>          | Git, Webpack, Cypress, Jest, Postman, Optimizely, LaunchDarkly                                |
| <b>Other</b>          | LLM-Powered Applications, AI-Assisted Development, Prompt Engineering                         |

## Work Experience

### Chia Network

Remote

#### SENIOR SOFTWARE ENGINEER

Aug 2024 - Mar 2026

- Architected Chia Cloud Wallet front-end flows in React and TypeScript for signing, confirmation, wallet state updates, and real-time blockchain synchronization across a platform supporting 1,000+ users
- Built high-trust wallet experiences for irreversible financial actions, including optimistic updates, error recovery, confirmation states, and reconciliation when blockchain state changed asynchronously
- Helped lay the groundwork for Chia Gaming, building early React and TypeScript patterns for blockchain gaming flows involving Chia state channels, WASM integration, off-chain signed gameplay, and wallet-backed actions
- Improved front-end performance and maintainability through code splitting, tree shaking, lazy loading, reusable UI patterns, and careful state management across complex wallet workflows
- Designed backend APIs for transaction lifecycle management, wallet balances, and distributed wallet state, giving the front end reliable data for blockchain-heavy user experiences

### SureFront

Los Angeles, CA

#### FRONT-END LEAD

Mar 2023 - Aug 2024

- Led a 5-person front-end team responsible for React and TypeScript architecture across complex B2B product configuration, merchandising, and order workflows
- Improved front-end test coverage from 13% to 77% by expanding Jest and Cypress coverage across critical user flows, data-heavy workflows, and shared React components
- Migrated legacy Redux patterns to Redux Toolkit across the full feature surface area, reducing boilerplate and improving maintainability
- Implemented Redux-Saga patterns for complex asynchronous workflows involving product, order, and configuration data
- Mentored engineers, reviewed front-end implementation patterns, and led bi-weekly architecture discussions to align best practices

### Avocado Finance

Los Angeles, CA

#### CO-FOUNDER

May 2021 - Oct 2022

- Co-founded and built a React Native fintech app, shipping the first production release in under 10 months and helping grow it to 2,000+ downloads and 400+ active users
- Led end-to-end product development including application architecture, feature delivery, and infrastructure decisions
- Integrated financial data providers including Plaid, Yodlee, and Finicity to enable secure account connectivity and financial data aggregation

### The Black Tux

Santa Monica, CA

#### SENIOR SOFTWARE ENGINEER

Jul 2016 - May 2021

- Built and optimized customer-facing front-end experiences for an e-commerce platform serving 500,000+ monthly visitors, including product pages, appointment scheduling, and checkout-adjacent flows
- Improved SEO, accessibility, and front-end performance across high-traffic pages through semantic HTML, reusable UI patterns, SPA optimization, bundle-conscious development, and Lighthouse audits targeting 90+ SEO and accessibility scores
- Helped decouple the front end from a Django monolith by building a React, Apollo GraphQL, and Node.js architecture that unified data from legacy and serverless systems
- Implemented extensive A/B testing infrastructure, helping product teams experiment across high-traffic customer journeys
- Built internal React and GraphQL tools that helped operations teams manage customer, order, and support workflows more efficiently

### WorthTheDownload

worththedownload.com

#### AI PROJECT

github: worththedownload

- AI-powered game recommendation app that helps players decide what to play, buy, wait on, or skip based on mood, taste, available time, and Steam game metadata
- Built and launched the app with Next.js, TypeScript, Tailwind CSS, and shadcn/ui
- Created server-side API routes for OpenAI and Steam integrations, including game search, detail lookup, free-text mood search, and structured AI recommendation outputs
